

NEW ABSTRACT

A shaving apparatus includes a base part and a shaving head mounted on the base part. The shaving head is pivotably mounted with respect to the base part about a pivot axis that runs parallel to a longitudinal direction of rows of cutting. The pivot axis is offset towards the base part with respect to the rows of cutting teeth in a depth direction relative to the base part. A spring is provided which spring-loads the shaving head counter to the depth direction away from the base part and towards a rest position of the shaving head.
